Stage: Grow-out = grow-out cages, Nursing = nursing cages. Broodstock and reserved stock are not recorded anywhere in the data. Mort % = deaths in window / (opening + stocked). *eFCR = feed in window / (closing biomass - opening biomass + harvested kg); indicative, from book counts x sampled ABW, not verified counts. Target: production_cycle.target_weight_g (250 g on older cycles) or the plan's 400 g where no cycle target is set.

Target variance (plan model v2 vs latest measured ABW)

Measured ABW is below the plan's starting ABW in 15 of 16 cages (see report 4). Plan harvest dates are therefore optimistic until the model is re-anchored to the measured weights.
